

## **AUTOMATION OF BUSINESS PROCESSES OF ENTERPRISES**

### **Автоматизация бизнес-процессов предприятия**

The problem of automation of business processes of enterprises is significant. The use of automated systems in the enterprise is an important component of the management and strategic development of production.

The purpose of this work is to study the features of automation of business processes of small, medium and large enterprises, to identify the features of the structure of the mechanism of functioning of business processes at enterprises.

The relevance of automation of business processes of enterprises is indisputable. In the modern world, it is impossible to imagine an enterprise without automated systems that allow solving a huge list of tasks at the enterprise.

To achieve this goal, it is necessary to carry out the following tasks: identifying the characteristic features of automated systems for small, medium and large enterprises; conducting a comparative analysis of automation and business processes of enterprises; identifying problems of introducing automation into the main processes of the production cycle of enterprises.

Currently, automation is an integral part of the company's business processes. The production life cycle is impossible without automation. Automation of business processes at enterprises is necessary to improve production efficiency. The introduction of automation is a complex process, but the purpose of this process is to improve the systems of companies. Small, medium and large enterprises may have different goals for implementing automation [1]. A small enterprise needs to simplify the work of a separate process, and a larger enterprise needs to create a unified system of the company's work with the help of automation [1]. Automation is designed to solve many problems related to the functioning of the enterprise, which human labor is not able to cope with. It greatly simplifies the work of manual labor, allows you to rationally use digital tools, automate certain actions that do not require the impact of human effort.

In order for the automation of business processes of enterprises to function successfully, it is necessary to understand the list of questions: are there differences in the business processes of small, medium and large enterprises? [2]. If the analysis of business processes of enterprises reveals differences, then what is their essence? [2]. But if a comparative analysis does not reveal differences between the business processes of small, medium and large enterprises, then perhaps the features of automation will differ

significantly in small, medium and large enterprises? [1]. The answers to these questions may be able to be considered in the listed sources.

## **EVOLUTION OF NON-CASH MONEY TURNOVER IN THE REPUBLIC OF BELARUS. DEVELOPMENT TRENDS AS OF JANUARY 1, 2022**

### **Эволюция безналичного денежного оборота в Республике Беларусь. Тенденции развития на 1 января 2022 года**

Nowadays, it is no longer possible to imagine your reality without a cashless payment. Paper money is rapidly being replaced by electronic money and bank cards. And a large, dominant role in money turnover is played by non-cash money turnover. The predominant development of non-cash money turnover in comparison with cash, a tangible kind of money turnover is explained by the fact that money moves much faster in non-cash money turnover than in cash, besides, the state greatly stimulates the development of non-cash settlement. Moreover, the correct organization and development of non-cash payments occupy an important place in the regulation of money circulation and everything that is in any way connected with money. In the context of widespread integration of international relations, constant and sustainable development of technologies, the rooting of non-cash payments is becoming more relevant than ever.
